Book Description

Title: Operations Research: An Introduction

Author: Hamdy A Taha

Publisher: Pearson

Edition: 9

Year: 2014

ISBN: 9780132555937

R numbering policy used in this document and the relation to the above book.

Exa Example (Solved example)

Eqn Equation (Particular equation of the above book)

For example, Exa 3.51 means solved example 3.51 of this book. Sec 2.3 means an R code whose theory is explained in Section 2.3 of the book.

Contents

List of R Codes

Chapter 2

Modelling with Linear Programming

R code Exa 2.2.1 Graphical Solution to LP Problems

```
##Chapter 2 : Modelling with Linear Programming
##Example 2-1 : Page 16

#To plot the line, we have to consider them as
   equation instead of inequality and express/
#them in terms of x2 :

#Constraint 1 : 6 * x1 + 4 * x2 <= 24
#Con1         : x2 = (24 - 6 * x1)/4
con1 <- function(x1) (24 - 6 * x1)/4
plot (con1, xlab = "x1", ylab = "x2", xlim = c(0,7),
    ylim = c(0,7), col = "red",
      main = "Example 2-1", yaxs= "i", xaxs = "i")
#xlab & ylab  : x and y label respectively
#xlim         : limits of x value on the plot
#ylim         : limits of y value on the plot
#col          : color of the line
#main         : Title of the plot
#yaxs & xaxs  : the style of axis interval
```

```
    calculation to be used by R. The default
18 #value is a 4% gap at each end of axis
19
20 #Constraint 2 : x1 + 2 * x2 <=6
21 #Con2 : x2 = (6 - x1)/2
22 con2 <- function(x1) (6 - x1)/2
23 plot (con2, add=T, xlim = c(0,7), ylim = c(0,7), col
       = "blue")
24 #add           : adds to an existing plot
25
26
27 #Constraint 3 : -x1 + x2 <= 1
28 #Con3          : x2 = (1 + x1)
29 con3 <- function(x1) (1 + x1)
30 plot (con3, add=T, xlim = c(0,7), ylim = c(0,7), col

library("boot")

simplex(a,C3,bc3,C2,bc2, C1,bc1 ,maxi = F)

#The method employed by this function is the two
   phase tableau simplex method.
#If there are >= or equality constraints an initial
   feasible solution is not
#easy to find. To find a feasible solution an
   artificial variable is introduced
#into each >= or equality constraint and an
   auxiliary objective function is defined
```

```
#as the sum of these artificial variables. If a
    feasible solution to the set of
#constraints exists then the auxiliary objective
    will be minimized when all of the
#artificial variables are 0. These are then
    discarded and the original problem solved
#starting at the solution to the auxiliary problem.
    If the only constraints are of the
#<= form, the origin is a feasible solution and so
    the first stage can be omitted.

#Area of the circle
ApproxArea=m*100/n
ApproxArea
```

R code Exa 17.3.3 Erlang distribution

```
##Chapter 17 : Simulation Modelling
##Example 3-3 : Page 691

#Function which returns an erlang distribution
erlang=function(m,lambda){
  R=c(0.0589,0.6733,0.4799)
  y=-log(prod(R))/lambda
  return(y)
}
erlang(3,4)
```

R code Exa 17.4.1 Multiplicative congruential method

```
##Chapter 17 : Simulation Modelling
##Example 3-3 : Page 691

#inputs for the random number generator
b=9
c=5
m=12

u=numeric()
#initial random  number
u[1]=11
```

```
13
14 R=numeric()
15 for(i in 2:4){
16   u[i]=(b*u[i-1]+c)%%m
17   R[i-1]=u[i]/m
18 }
19 R
```

Chapter 18

Classical Optimization theory

R code Exa 18.1.1 Necessary and sufficient conditions

```
##Chapter 18 : Classical Optimization theory
##Example 1-1 : Page 714

#Function to be given as input to optim function
minimize<-function(x){
  x1=x[1]
  x2=x[2]
  x3=x[3]
  return(-(x1+2*x2+x2*x3-x1^2-x2^2-x3^2))
}

#Calculates the optimal value
optim(c(0,0,0),minimize,hessian = T )
#the Jacobian for each
f=expression(x1+2*x2+x2*x3-x1^2-x2^2-x3^2)
for(i in 1:3){
  x=D(f,paste("x",i,sep = ""))
  print(x)
}
```

R code Exa 18.1.3 Newton Raphson method

```
1 ##Chapter 18 : Classical Optimization theory
2 ##Example 1-3 : Page 717
3
4 #The function expression has to be given as function
      to nlm function
5 g<-function(x){
6   return((3*x-2)^2 * (2*x-3)^2)
7 }
8 #calling nlm function with function g and initial
     guess 0
9 nlm(g,0)
```
